BiteByChoice Project Documentation (Simplified)

1. Project Title

BiteByChoice – Online Food Delivery System

2. Synopsis

BiteByChoice is a website for a cloud kitchen in Kanchipuram. It allows customers to create accounts, log in, and view food services. It also has an admin panel to manage orders and view revenue. The system uses a modern dark design and secure login methods.

3. Modules Description

- **User Module:** Customers can register, login, view the home page, about us, and contact details.
- **Admin Module:** Administrators can log in to view a dashboard with order tables and revenue stats.
- **Authentication Module:** Handles secure login and registration using PHP and MySQL. Passwords are encrypted.
- **Order Module:** Fetches customer details (Name, Email, Mobile) for order processing (via order_customer.php).

4. UI Form Design

- **Login Page (index.html):** Centered box, dark background, floating labels for username and password.
- **Registration Page (register.html):** Wider box, fields for username, email, mobile, and password with validation messages.
- **Home Page (food-website.html):** Navigation bar, hero section, and feature cards (Fast Delivery, Expert Chefs).
- **Admin Dashboard (admin.html):** Tables to show order details, status, and revenue summary.
- **Theme:** Dark blue background (#1a1a2e), purple buttons, glass-effect containers.

5. Database Table Structure

Database Name: bitebychoice

Table: register (Existing)

Field	Type	Description
`id`	INT	Unique User ID (Auto Increment)
`uname1`	VARCHAR(50)	Username
`email`	VARCHAR(100)	User Email (Unique)
`mobile`	VARCHAR(15)	10-Digit Mobile Number
`upswd1`	VARCHAR(255)	Encrypted Password
`created_at`	DATETIME	Registration Time

Table: orders (Proposed for Admin Panel)

Field	Type	Description
`order_id`	INT	Unique Order ID
`uname1`	VARCHAR(50)	Customer Username
`items`	TEXT	Food Items Ordered
`total_amount`	DECIMAL	Bill Amount
`status`	VARCHAR	Pending/Completed

6. Proposed System Architecture

- **Frontend:** HTML (Structure), CSS (Design), JavaScript (Validation & Interaction).
- **Backend:** PHP (Server logic for Login, Register, and Data Fetching).
- **Database:** MySQL (Stores user and order data).
- **Communication:** JavaScript sends data to PHP using fetch(), PHP replies with JSON.

7. Flow Diagram (Step-by-Step)

1. **Start:** User opens the website.
2. **Login/Register:**
    - New User → Goes to Register → Enters Details → Saved to DB → Redirect to Login.
    - Existing User → Enters Username/Password → PHP Checks DB → Login Success.
3. **Home:** User sees the main page (food-website.html).
4. **Order:** User selects food → Checkout → System fetches user details (order_customer.php).

5. **Admin:** Admin logs in (Special credentials) → Views Order Dashboard.
6. **End:** User clicks Logout → Returns to Login page.

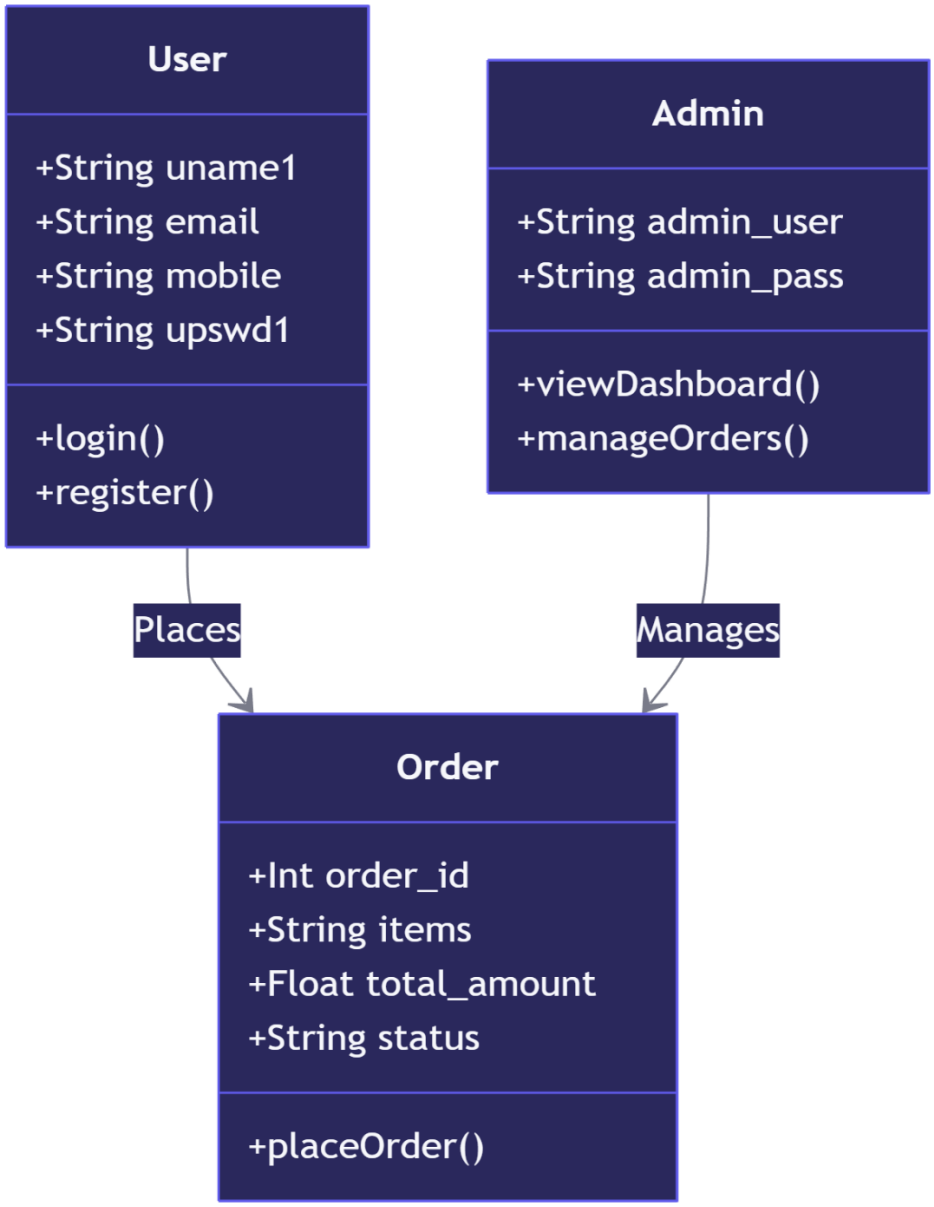
8. UML Diagrams

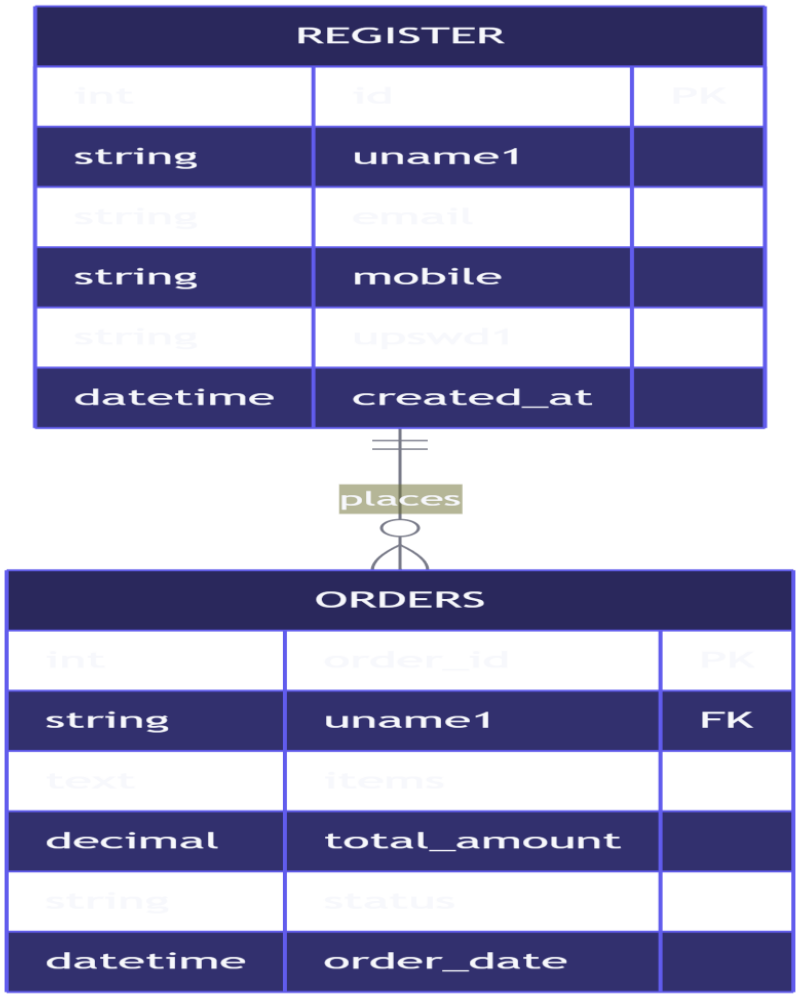
Use Case Diagram

- **Customer:** Can Register, Login, View Menu, Contact Support.
- **Administrator:** Can Login, View Dashboard, Manage Orders.

Class Diagram

- **User Class:** Stores username, email, mobile. Methods: login(), register().
- **Admin Class:** Stores admin credentials. Methods: viewDashboard().
- **Order Class:** Stores order details. Methods: placeOrder().



9. ER Diagram (Entity Relationship)


- **Entity 1:** REGISTER (Users)
- **Entity 2:** ORDERS (Customer Orders)
- **Relationship:** One User can place **Many Orders** (1-to-Many Relationship).
- **Link:** The uname1 field in the orders table connects to the register table.
